SASYATHRA — Concise Problem & Solution

The Problem

— The Problem —

Farmers usually produce first and search for buyers later. This causes:

- Uncertain prices and distress sales
- Dependence on middlemen
- Post-harvest losses
- Poor access to direct buyers
- High processing and transportation costs
- Lack of transparency in the final price

Our Solution

— Our Solution —

Sasyathra is a demand-first agricultural marketplace and coordination platform.

Instead of:

Farmer → Produce → Market → Search for Buyer

the process is reversed:

Buyer Demand → Farmer Matching → Processing → Logistics → Direct Sale

How It Works

— How It Works —

1. Collect Demand

Hotels, supermarkets, restaurants, institutions, and consumers post what they need — crop, quantity, quality, location, and delivery date.

2. Match Farmers

Sasyathra identifies farmers who can supply that demand.

3. Farmers Retain Ownership

Sasyathra never buys the produce and resells it. The farmer owns the produce until it is sold.

4. Village-Level Processing

For crops like paddy, farmers can use cooperative-owned processing machines when demand is confirmed.

5. Store Smartly

For rice, paddy can be stored instead of large quantities of milled rice, and milled only when required.

6. Aggregate & Deliver

Produce from multiple nearby farmers can be combined, processed, packaged, and transported efficiently.

7. Individual Consumers
If an individual needs a small quantity that isn't practical for direct delivery, Sasyathra can direct them to a nearby supermarket or retailer supplied through Sasyathra.

8. Transparent Pricing
The buyer can see where the money goes:

Farmer price + Processing + Packaging + Storage + Transport + Platform fee = Final price

Revenue Model
— Revenue Model —

Sasyathra doesn't make money by buying cheap and selling high.

- **25% of the farmer's profit** is charged only when the farmer makes a profit.
- Consumers/buyers pay a separate **platform/service fee**.
- Processing and logistics costs are shown separately.

Logistics
— Logistics —

Sasyathra coordinates:

Farm → Aggregation → Processing → Storage (if needed) → Packaging → Transport → Buyer

The platform can optimize farmer selection, processing location, vehicle allocation, route, and delivery timing to reduce unnecessary transportation costs.

Why Cooperatives?
— Why Cooperatives? —

Instead of depending entirely on commercial mills that may prefer buying and selling produce themselves, village cooperatives can own or operate processing equipment.

Farmers don't surrender their produce to the cooperative. They simply use the cooperative's infrastructure to process their own produce and sell it through Sasyathra.

What Makes Sasyathra Different?
— What Makes Sasyathra Different? —

Demand-first + Farmer ownership + Village-level processing + Transparent pricing + Coordinated logistics + Traceability

In One Line
— In One Line —

Sasyathra connects farmers to real demand before production reaches the market, while coordinating processing and logistics so farmers retain ownership and more value stays within the farming community.
